Improving Protein Function Prediction with Molecular Dynamics Simulations

Dariya Glazer

Russ Altman

Motivation

Sometimes the 3D structure doesn't score well for a known function.

The experimental structure may have an altered configuration of atoms.

Possible Solution

Treat molecules as dynamic entities, sample other conformations and test for function

Potential Energy function:

$$U = \sum_{bonds} K_b (b_i - b_o)^2$$

$$+ \sum_{angles} K_\theta (\theta_i - \theta_o)^2$$

$$+ \sum_{dihedrals} K_\phi \left[1 - \cos(n\phi_i + \delta)\right]$$

$$+ \sum_{pairs} \varepsilon \left[\left(\frac{r_o}{r_{ij}} \right)^{12} - 2 \left(\frac{r_o}{r_{ij}} \right)^{6} \right]$$

$$+ \sum_{charges} \frac{q_i q_j}{r_{ij}}$$

Molecular Dynamics

- Given the equations for energy, and the time scale, perform a large numerical simulation to see how the molecule moves.

- Time step = 0.001 ps
- Starting point = experimentally defined structure (already in good local minima)
- Include water molecules around protein
- Goal: study dynamic motion of protein

Numerical Solution for M.D.

$$x(t+\Delta t) = x(t) + v(t)\Delta t + \left[4a(t) - a(t-\Delta t)\right]\Delta t^2/6$$

$$v(t+\Delta t) = v(t) + \left[2a(t+\Delta t) + 5a(t) - a(t-\Delta t)\right]\Delta t/6$$

$$U_{kinetic} = \frac{1}{2}\sum m_i v_i(t)^2$$

$$U_{potential} = \ldots$$

$$U_{total} = U_{kinetic} + U_{potential}$$

$$F = dU / dx$$

$$a = F / m$$

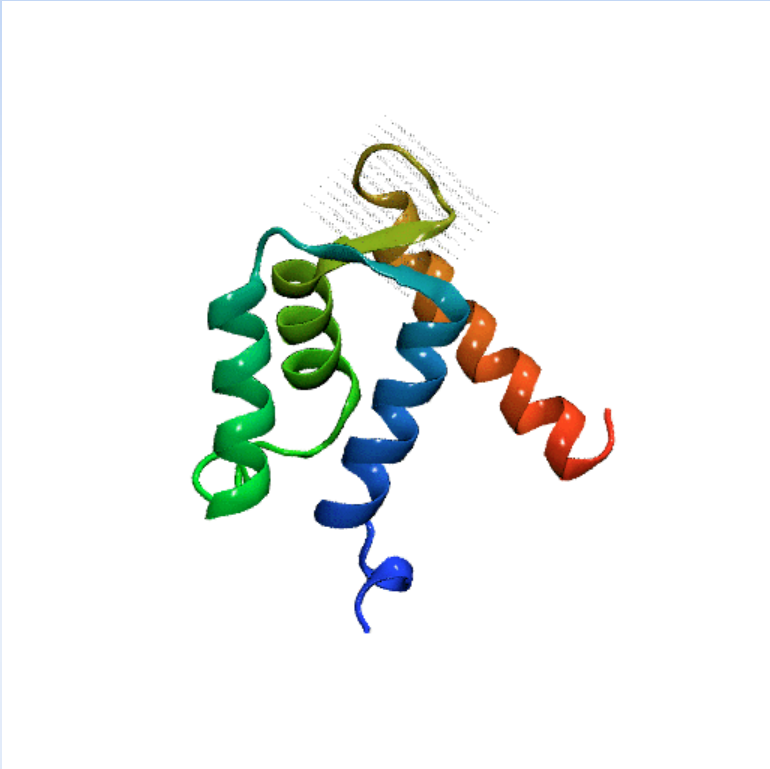
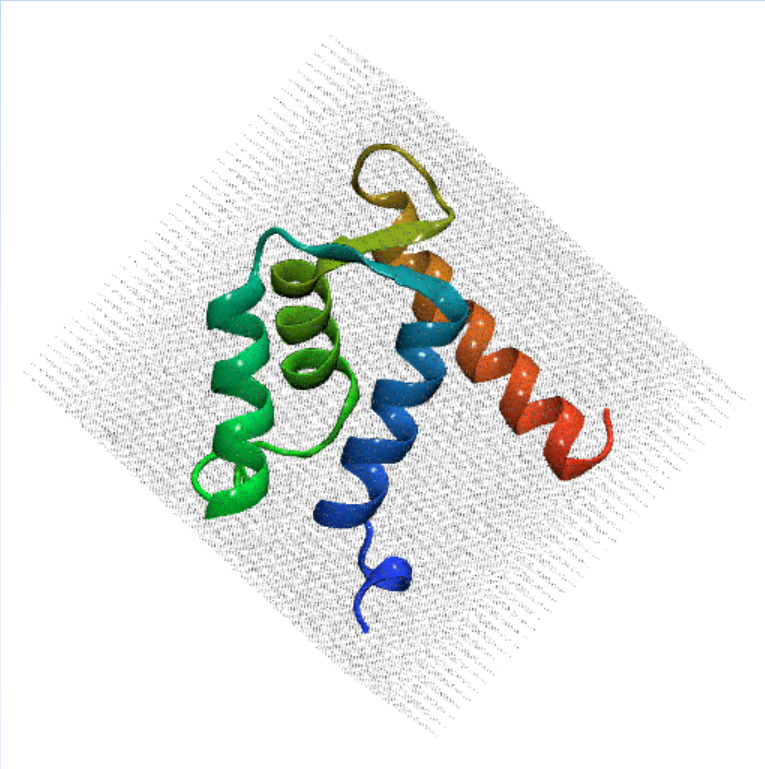
Threshold score of this model is 50

Simulation Analysis



Local Grid: to observe dynamics of a known binding site

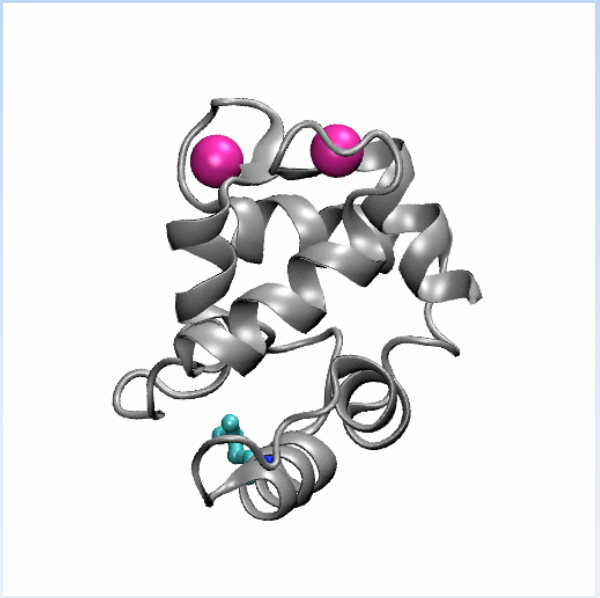
- Keep only the topmost score for each frame

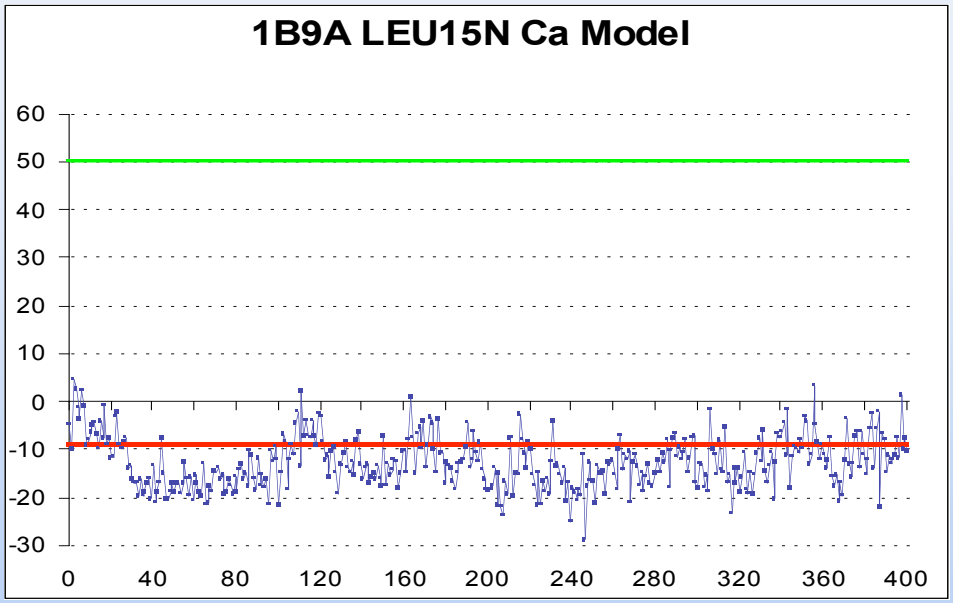


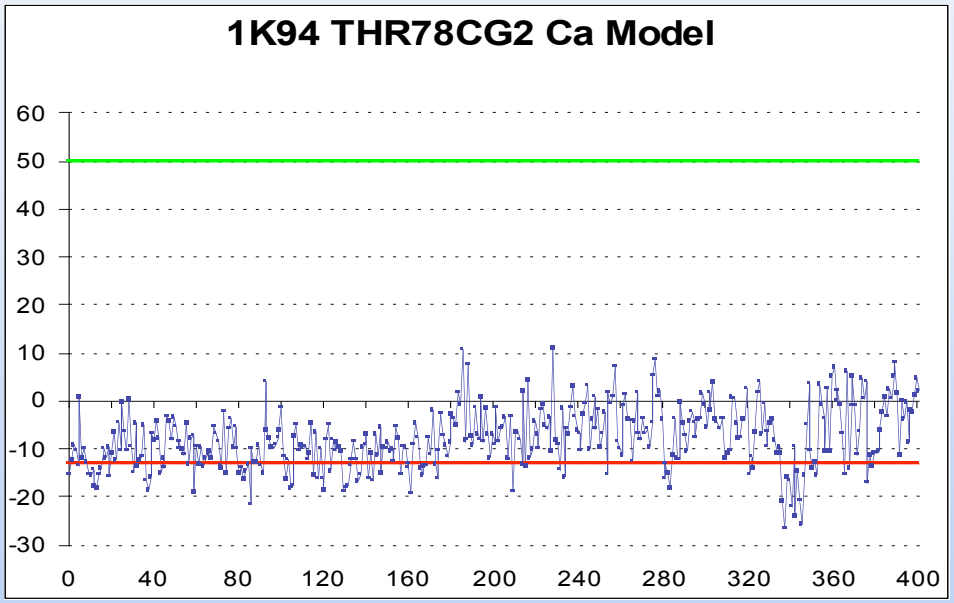
Global Grid: to find all possible binding sites in a given structure

- Keep all scores over 50 for each frame

Local Grid: Non-Sites Score Low







Simulation **Original Score** **Model Threshold**

Results Agree With Experiments

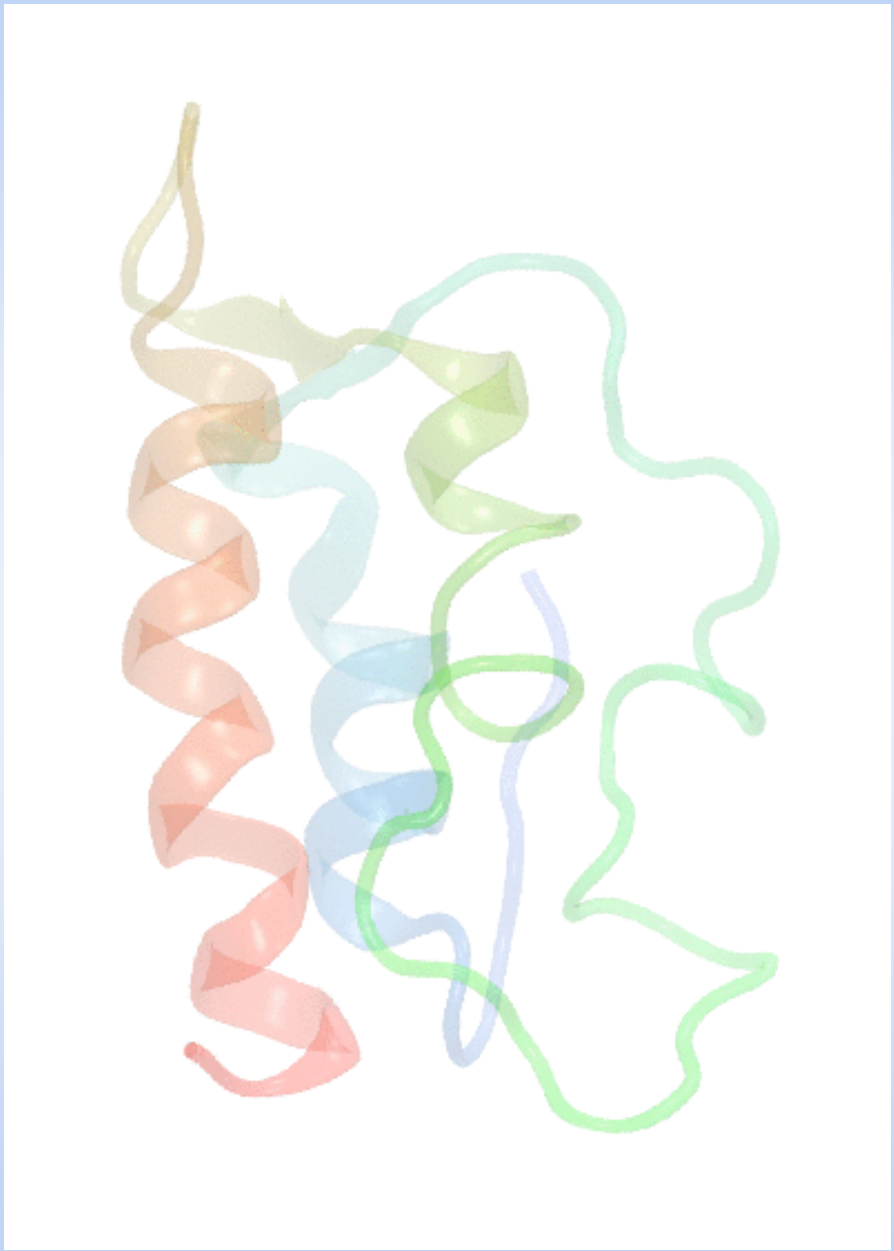
MD + FEATURE
10 HOLO and 9 APO

1.4 – 3 Fold Improvement



Protein adopts functional conformations during simulation.

Simbios: National Center for Physics-Based Simulation of Biological Structure

- NIH-funded resource to promote biomedical computing (one of seven)
- Devoted to biological structural simulations at all scales
- Two-fold mission:
  - Perform high quality research
  - Disseminate software and models to others
- Also publish quarterly magazine "Biomedical Computation Review"

NIH Center for Biomedical Computation at Stanford

Where To Get Downloads

Applications and Models: Free downloadable stand-alone simulation software and models

Core Simulation Technology: Free downloadable source code for the underlying algorithms and computational tools for simulations in a variety of biological application areas

All Projects with Downloads: All available free downloadable software and data

Featured Project

Release of OpenSim 1.0: OpenSim is an open-source software system that lets users develop models of musculoskeletal structures and create dynamic simulations of movement.

Visit the OpenSim Project and download the **new** OpenSim 1.0 release.

Learn more about our latest OpenSim Workshop (8/22/07) on using OpenSim 1.0.

How to Contribute

Biological Application Areas

Biomolecular Simulations:

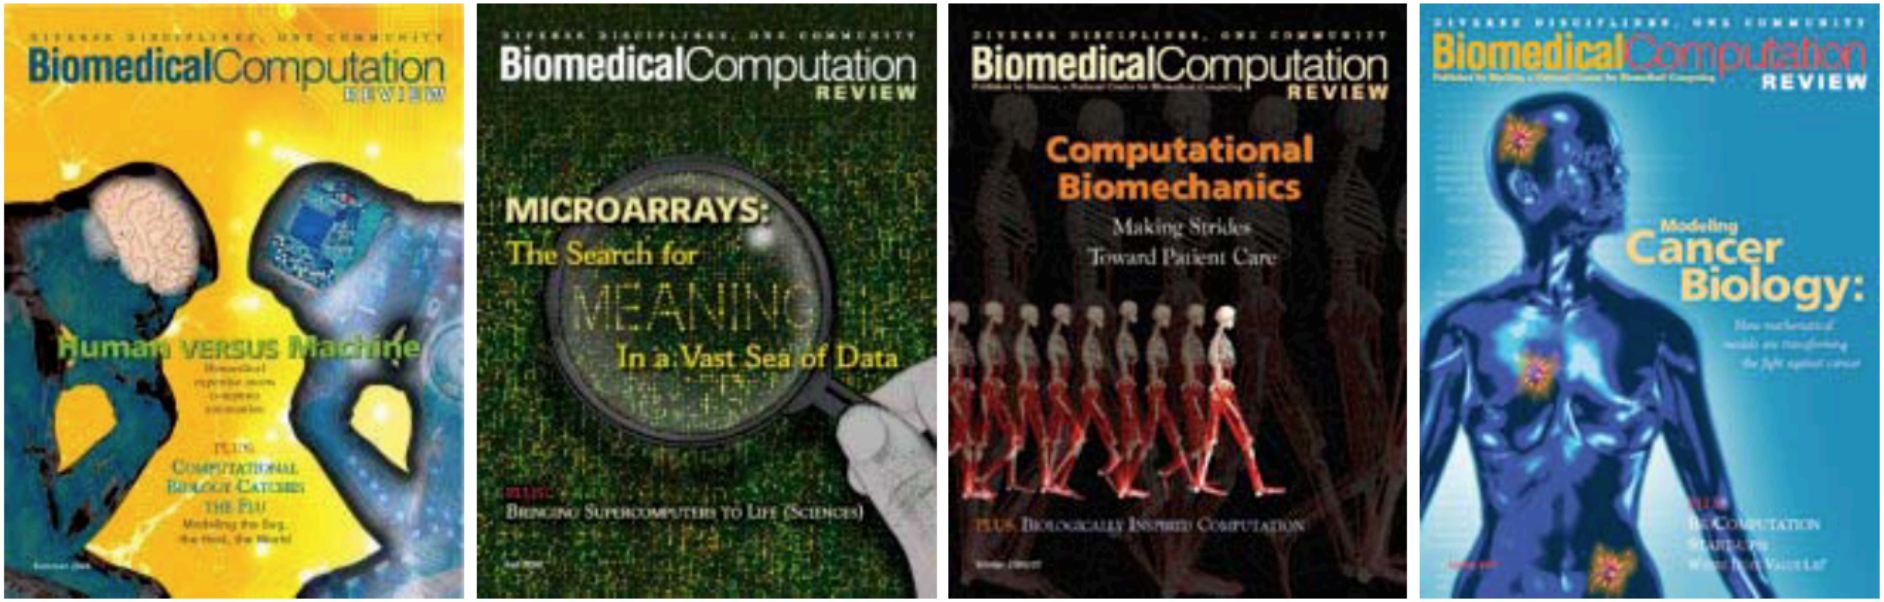
RNA Folding

Myosin Dynamics

Cardiovascular Dynamics

Neuromuscular Biomechanics

Biomedicalcomputationreview.stanford.edu



Covers of the four issues of *Biomedical Computation Review* from this past year.

Conclusions

- We can build statistical models of functional sites in proteins based on 3D structures
- We can use these models to recognize function in new structures
- We can extend the range of our models by adding physics-based simulation
- Challenges:
  - Discovering and labeling new functions
  - Applying in high-throughput to all structures
  - Using for drug design/discovery

Thanks!
